

|   |  |
|---|--|
| <i>Use case name</i>                        | System notifies user of failure  |
| <i>Participating actors</i>                 | System, user   |
| <i>Flow of events:<br/>Normal flow</i>      | <ol style="list-style-type: none"> <li>1. The user accesses the GUI of the system</li> <li>2. The system displays an alert indicating that a previously connected feeder has unexpectedly gone offline</li> <li>3. The user clicks on the alert message</li> </ol> |
| <i>Flow of events:<br/>Alternative flow</i> | <p>Condition 1 – a feeder has been deliberately and permanently taken offline</p> <p>1.– 3. Same as Normal flow</p> <p>4. The user makes the system ‘forget’ the hopper</p>  |
| <i>Pre-condition</i>                        | Feeders have been set up as detailed in use case “User Sets Up Network”. A feeder is no longer reporting data at the regular interval.   |
| <i>Post-condition</i>                       | The user is aware of all dysfunctional feeders and is presented with a list of possible remedies (Normal flow), OR a dysfunctional feeder is disassociated, and the alert cleared (Condition 1)  |
